TITLE: Weight Accuracy and Quotas of Consumption of Rolled Metal  
(Vesovaya tochnost' i normy raskhoda metalloprokata)

PERIODICAL: Standartizatsiya, 1958, Nr 3, pp 21-25 (USSR)

ABSTRACT: The volume, and hence the weight of hot-rolled profiled iron depend on the tolerances on profiles. In practice, the deviations of volume and weight from nominal values reach 13% with round bar iron, 15% with sheet, 19% with strip, 21% with angle iron and 15% with pipes. When an order for metal is specified in weight units .. the quantity supplied may turn out to be insufficient. The author suggests formulas for calculating the possible variations of weight within the given tolerance range for the above types (Table 1). The two coefficients ("2" and "k") used in these formulas can be readily determined by calculation or graphically. There are 2 tables and 2 graphs.

TITLE:

Economical Weight Accuracy of Castings (Ekonomicheskaya tochnost' vesa otlivok)

PERIODICAL:

Liteynoye Proizvodstvo, 1958, Nr 5, pp 6-9 (USSR)

ABSTRACT:

The specific weight of gray and malleable cast iron in castings can vary in a wide range, and various technological factors (dimension errors in models and core boxes, different densities of molding earth, etc.) affect the accuracy of the volume of castings. The article gives the results of tests carried out on agricultural machine parts and different other castings to determine the variations in the weight of castings produced by normal technology. It was revealed that in a lot of similar castings, the weight can vary within a range from  $\pm 3.3$  to  $\pm 12.15\%$  of the mean arithmetical weight, i.e. that maximum weight deviations are possible in a range between 6.6 to 24.30%. A graph and a formula were evolved for determining the possible mean square deviation of the weight of castings from the nominal. There are 3 figures, 3 tables, and 8 Soviet references.

AUTHOR:Aldakimov, V.P., and Shtanko, M.G., Engineers  
Size and Weight Accuracy of Precision Investment

TITLE:

Castings

PERIODICAL:

Liteynoye proizvodstvo, 1959, Nr 8, pp 5 - 8 (USSR)

ABSTRACT:

In order to estimate the size and weight accuracy of the components, produced by precision investment casting, which is one of the most progressive and most economical casting methods, the authors experimented in the zavody Rostovskogo sovmarkhoza (Plants of the Rostov Council of National Economy). For the experiments, 15 different parts of different shape, weight (20 - 2000g) and dimensions (4-110mm) were selected and cast under the same conditions. The results were statistically estimated and put together in 6 tables and 5 graphs. The parameters of  $\bar{x}$  (arithmetical mean of weight and dimension) and  $s_x$  (quadratic mean of divergence) are similar to the known curves of Gauss and to the criteria of consent calculated by Bernstein, Romanovskiy and Kolmogorov. The graphs show that there is a correlated link.

TITLE: Interchangeability of machine construction production  
by weight

PERIODICAL: Standartizatsiya, no. 2, 1962, 3-9

TEXT: The Institut sel'skokhozyaystvennogo mashinostroyeniya (Rostov-na-Donu) (Institute of Agricultural Engineering (Rostov-on-Don) for some years carried out research on establishing the interchangeability of components by their weight. At present they study the law governing the distribution of weight of workpieces manufactured by different methods. A theory of the gravimetric accuracy of technological processes has been worked out. The weight adjustment of components is ensured by changes in specified dimensions which are indicated in the drawings of the concerned parts. The necessity of the above control arises in cases where the quality of the component depends on its weight, as for instance, in sintered or cast items, or forgings. The author points out the lack of a ✓

## Interchangeability of machine ...

weigher at factories, where the consumption of metal is computed with the use of tables or at a glance. It is necessary to find the laws of scattering in the weight of components within a batch which may exhibit systematic and random character. In the case of random causes, and assuming the normal law of distribution the curve is similar to the ordinary error curve. The relationship between the geometric and gravimetric accuracy of components is then given by  $\lambda = \frac{G_n - G_a}{G_n} \cdot 100$  or by  $\lambda = \frac{V_n \gamma_n - V_a \gamma_a}{V_n \gamma_n} \cdot 100$ ,

where  $G_n$  and  $G_a$  are the nominal and actual weights of the component;  $V_n$  and  $V_a$  the nominal and actual volumes of components;  $\gamma_n$  and  $\gamma_a$  the selected weight in the calculation and actual specific weight of material of the component;  $\lambda$  is the deviation in the component weight from the nominal value in percent. On the assumption that the specific weight is correct, i.e.  $\gamma_n = \gamma_a$ , then  $\lambda = \frac{V_n - V_a}{V_n} \cdot 100$ . This equation permits

Card 2/4

**Interchangeability of machines ...**

establishment of the relationship between the dimensions as well as tolerances and  $\lambda$  for rolled sections. Equations for various workpieces giving the magnitude of the corresponding  $\lambda$  in the case of revolution bodies are tabulated. Weighing and analysis by the method of mathematical statistics demonstrates that the weight distribution in a batch of components follows the normal law. This was observed when the manufacturing process did not exhibit substantial deviations from its normal course. The deviation in the weight,  $\Delta G_a$ , can, therefore, be determined by  $\Delta G_a = 6\delta$  or  $\Delta G_a = 6CG_a^x$ , where  $G_a$  is the actual weight of component;  $C$  and  $x$  are quantities related to the manufacture of workpieces. This law was found in the case of hot stamping in closed and open dies, using malleable castings made in permanent moulds. The condition is different when other types of casting process are employed. The deviation from the established weight of agricultural machines, or any other units may affect their stability and result in premature wear. The developed method of accuracy control of the technological processes can be used for investigating gravimetric accuracy. The changes in volume or density within the time may be due to several factors, which are enumerated.

AUTHOR: Shtan'ko, N.G., Candidate of Technical Sciences

TITLE: The Synthesis of Unsaturated Polyester Resins and Varnish Production Based on Their Use

PERIODICAL: Khimicheskaya nauka i promyshlennost', 1959, Vol 4, Nr 3, pp 294-302 (USSR)

ABSTRACT: Varnishes based on unsaturated polyesters are solutions of these polyesters in monomers. Initiating agents induce the formation of three-dimensional polymers from the linear polyesters. The film-forming material in the polyesters comprises 85 - 100%, because the monomeric solvent enters the final compound. For the synthesis of linear polyesters various dibasic acids and two-atomic alcohols are used. The anhydride of the maleic acid, and the itaconic acid, which is highly reactive due to its double bond, are the components which are mostly used. Dibasic saturated acids are introduced for increasing elasticity. The alcohols are mostly ethylene glycol, propylene glycol and diethylene glycol. Styrene is the monomer which serves as a solvent for polyesters. Vinyltoluene is less volatile so that the losses during film formation are lower. Mono-methylmaleate, diallylphthalate, vinylacetate, etc, may also be used [Ref 4, 7]. Polymerization is induced

Card 1/5

SOV/63-4-3-2/31

The Synthesis of Unsaturated Polyester Resins and Varnish Production Based on Their Use

by various peroxides and hydroperoxides which react only at increased temperatures. Activators are applied to start the reaction already at room temperature. Polymerization agents are benzoyl peroxides, methyl-ethylketone and cyclohexanone. Activators are tertiary amines, especially dimethylaniline, and cobalt salts which are soluble in hydrocarbons, like naphthenate and octoate. Dolgoplosk [Ref 12] has shown that these salts should be introduced in quantities considerably lower than the stoichiometric ones. The hardening of the varnishes depends on a correct concentration of the activator. The oxygen of the air has an inhibiting effect on the drying of the polyester films. This is due to its reaction with free radicals and the oxidation of metal protioxide ions which impedes the formation of free radicals [Ref 16]. Paraffin and similar substances are added to the varnishes in order to form a protective cover against oxygen. Polyester varnishes are unstable and gelatinize even at room temperature, so hydroquinone and pyrocatechol are added. It has been shown that the inhibiting effect is caused by quinones formed during oxidation, which break the chain [Ref 23 - 26]. The quantity of inhibitors usually does not exceed a few hundredths of a percent. Solvents are added in the amount of 5 - 15% in order to re-

Card 2/5

SOV/63-4-3-2/31

The Synthesis of Unsaturated Polyester Resins and Varnish Production Based on  
Their Use

duce the viscosity of polyester resins. Acetone, methylethylketone, methanol, ethylacetate, etc, not only reduce the viscosity, but also increase the stability of the varnish solutions during storing [Ref 27]. The thixotropic properties are improved by adding silice. Titanium dioxide, lithopone, cadmium yellow, red iron oxide, etc, are the pigments mostly used. Barite, asbestos powder, chalk, microtalc, etc, are the usual fillers. The application of paraffin and other wax-like substances causes a dull surface. This may be avoided by using solid unsaturated polyester resins instead of the viscous liquids. The surface layer in this case consists of linear polyesters instead of three-dimensional polymers. The introduction of the diallyl ester of dimethylol urea and other compounds leads to the formation of a shining surface layer, because these compounds dry under the oxidizing effect of air oxygen. Recently hexamethyolmelamine is used, in which a part of the methylol group is esterified by unsaturated polyesters and another part by allyl alcohol [Ref 39]. The polyesterification of maleic acid is accompanied by isomerization of the acid to fumaric acid. The isomerization proceeds rapidly in the presence of phthalic acid. Isomerization considerably affects the polymerization rate, since the

Card 3/5

SOV/63-4-3-2/31

The Synthesis of Unsaturated Polyester Resins and Varnish Production Based on  
Their Use

trans-isomers of 1,2-substituted ethylenes are more active than cis-isomers. The preparation of unsaturated polyester resins is carried out in enameled reactors by means of catalysts, especially n-toluene-sulfoacid. The process is controlled by determining the acid numbers of the resins and the viscosity of their solutions. An acid number of 20 - 40 mg KOH/g and a molecular weight of 3,000 is the average. The mixing of the polyester resin with the polymerization agent causes quick gelatinization. A two-component pulverizer is used therefore, in which the mixing is made in front of the jet, or the polymerization agent is applied to the surface to be painted and the polyester varnish on top of it. Polyester varnishes are used for finishing wood objects, like furniture, television sets, railroad cars, etc. Recently concrete, stone, etc, are also painted with these materials. The preparation of such paints with a good adhesion to metal is given in Ref 37, 68.

temperature influence on the mobilism of carbon-14 absorbed in the process of photosynthesis. O. V. Zaitsev,  
S. I. Voznesenskii, M. N. Lomantseva, and T. P.  
Krylov, V. L. Voznesenskii, and Sh. S. Tashbaev, S.T.S.R.

Summarizing the results of our experiments, we can say that the absorption of CO<sub>2</sub> in the leaf is accompanied by a rapid increase in the rate of photosynthesis. With a  
rate of absorption of 10-15% of the total leaf area per second, the rate of photosynthesis increases by 10-15 times. At the same time, increased rates of photosynthesis are observed at temperatures of 20-25°C, while at higher temperatures (30-35°C) the rate of photosynthesis is reduced. This is due to the fact that at higher temperatures the rate of respiration increases, which leads to a decrease in the rate of photosynthesis. The rate of respiration is influenced by many factors, such as temperature, light intensity, and the presence of inhibitors. In this case, there is an inhibitory effect of the heat on the rate of respiration. The rate of respiration is also influenced by the concentration of CO<sub>2</sub> in the air. At low concentrations of CO<sub>2</sub>, the rate of respiration is reduced, while at high concentrations it is increased. This is due to the fact that at low concentrations of CO<sub>2</sub> the rate of diffusion of CO<sub>2</sub> from the air into the leaf is slow, while at high concentrations it is fast. The rate of diffusion of CO<sub>2</sub> is proportional to the square root of the concentration of CO<sub>2</sub>. Therefore, at high concentrations of CO<sub>2</sub>, the rate of diffusion is faster, and the rate of respiration is higher. The rate of diffusion of CO<sub>2</sub> is also influenced by the temperature, humidity, and light intensity. At high temperatures, the rate of diffusion is higher, while at low temperatures it is lower. At high humidity, the rate of diffusion is lower, while at low humidity it is higher. At high light intensity, the rate of diffusion is higher, while at low light intensity it is lower. The rate of diffusion of CO<sub>2</sub> is also influenced by the presence of inhibitors, such as chlorophyllin, which reduces the rate of diffusion of CO<sub>2</sub>.

the distribution of the species are well distributed. In the eastern part of the basin there is a decrease in the number of species and here it is again a decrease in variety of the fauna, particularly in the northern part. A further, more important, variation is observed with the increase of the elevation. On the contrary, in the lower parts of the basin the number of species is greater. The following table gives the number of species in each of the 11-12 areas of the basin.

A Portable Device for an Individual Distillation of Salt Water Under Field Conditions  
which carries the opposite charge, is easily soluble.

The combined use of both cartridge and salt water moves all the ions from the water: the water is dissolved. The whole device consists of a bottle made from polyethylene resistant to many chemical compounds and acids. As distilling agents, the best Soviet products are used: XU-2 catalyst and EDE-10 antinote. These two reagents duce two types of ion-exchanging absorbents are used:

XU-2 catalyst and EDE-10 antinote. These two reagents are packed together in a waterproof polyethylene envelope. 150 frames of this substance is needed for the distillation of 3 liters of water. Dimensions and weight of both the bottle and package vary. There is a photograph.

TITLE: Purification of water contaminated with botulism toxin by means of ion-exchange polymers

SOURCE: Giglyena i sanitariya, no. 4, 1965, 12-16

TOPIC TAGS: water purification, ion exchange, botulism, sorption, polymer

ABSTRACT: The article gives the results of experiments to purify water of Cl. botulinum (type A) with the highly acid cationite KU-2 (4, 6, and 18% divinylbenzol) and the highly alkaline anionite AV-17 (6, 16 and 18% divinylbenzol). The water was filtered through 12-15 cm of ground polymer in a glass column at a rate of 3-5 meters per hour. The effectiveness of the ionites was shown in biological tests. Inactivation is explained by the combined effect of sorption, which is quite important in this process, and the denaturing effect of elements of the medium (the acidic filtrate and alkaline solutions) which are formed because of the ion exchange. The processes are not mutually exclusive but complementary. Orig. art. has: 4 tables.

TITLE: Purification of virus contaminated water by means of ion exchange polymers

SOURCE: Gigiyena i sanitariya, no. 11, 1965, 29-33

TOPIC TAGS: water purification, water purifying compound, ion exchange resin, virus, bacteria, sorption

ABSTRACT: The possibility of using ionites to decontaminate water of viruses as well as of bacteria was investigated. Ion exchange polymers can render virus-contaminated water harmless. The mechanism is a combination of sorption and the denaturing action of aggressive agents, primarily alkalis. These virus-resin interaction processes do not appear incompatible; they take a parallel course and complement each other. The sorption of viruses and of bacteria onto the polymers is not identical: the microbe reaction with resins proceeds according to electrostatic attraction laws and is determined by the properties of the

UDC: 614.445:576.858-084.48:678.7

Card 1/2

L 27486-66

ACC NR: AP6011836

functional groups of the ionites and the charge of the cage; these are not ascertained in the action between viruses and sorbents. The physico-chemical structure of the sorbent plays an important role in the separation of bacteria; the degree of polymer cross-linkage does not significantly affect sorption of viruses. Increasing polymer dispersion increases its sorption activity toward viruses. Demineralizing water with the ionite system AV-17 (OH-form) + KU-2 (H-form), whereby an alkaline filtrate is formed, effectively decontaminates it from pathogenic agents. Orig. art. has: 4 tables.

AUTHORS: Zimin, V. N., Sintanskiy, V. A.

TITLE: Efficiency of Smelting Low-Grade Ferrosilicon in Blast and Electric Furnaces

PERIODICAL: 'Stal', 1960, Nr 3, pp 269-273 (USSR)

ABSTRACT: There are two methods of smelting low-grade ferrosilicon: (1) in blast furnaces; (2) in electric furnaces. The workers of the State Institute for the Design and Planning of Steel Industry ('Giprostal'), S. A. Livshits and I. A. Radchenko, proved that at Chelyabinsk Metallurgical Plant (ChMZ) the smelting of ferrosilicon is carried out more economically in a blast furnace. However, the calculations of State Institute for the Design and Planning of Metallurgical Plants ('Gipromez') show that in the eastern, and especially in the western, part of the USSR, it is more economical to produce low-grade ferrosilicon in electric furnaces. The authors studied the arguments presented and arrived at the following conclusions:  
(1) In view of transportation and operational costs, the

Card 1/2

Efficiency of Smelting Low-Grade  
Ferrosilicon in Blast and Electric Furnaces

78193

SOV/133-60-3-18/24

production of electrothermal ferrosilicon would be cheaper than its production by blast furnaces in the eastern USSR. (2) Although the initial capital investment in the electrothermal process is 9% greater (for the eastern area) than in the blast furnace process, the investment is amortized after 1.7-3.4 years of operation. (3) In the future, the net cost of the electrothermal process may be reduced by the following: (a) substitution of coal for small coke; (b) reduction in price of electric energy; (c) utilization of a 25% ferrosilicon as a reducing agent; (d) smelting ferrosilicon in high-capacity electric furnaces. (4) For the southern USSR, the economy is even greater than for the eastern area. (Publisher's note: The authors do not take into account the rapid wear and increasing maintenance costs of blast furnaces, which are one more argument in favor of electrothermal process. There are 2 tables; and 2 Soviet references.

TITLE:  
Means of Raising the Technical Level and Lowering the Construction Cost of Irrigating and Meliorating Systems (Puti povyseniya tekhnicheskogo urovnya i snizheniya stoimosti stroitel'stva orossitel'nykh, osushitel'nykh i obvodnitel'nykh sistem)

PERIODICAL:  
Gidrotekhnika i Melioratsiya, 1958, # 4, pp 17-39 (USSR)

ABSTRACT:  
A general review of past achievements and future tasks in the field of irrigation and melioration is given. The main deficiencies in the field are: insufficient mechanization of construction work, a shortage of excavating machines and other construction equipment, late deliveries of spare parts for machines and a too wide dispersal of funds over a multitude of enterprises. The main shortcomings at the planning stage are: insufficient use of means to cut down filtration losses of water in the canals; insufficient utilization of sprinkling; insufficient development of drainage systems, a careless leveling of irrigated fields, the most important factor in an

Card 1/3

Means of a Raising the Technical Level and Lowering the Construction Cost  
of Irrigating and Meliorating Systems

economical use of water. During the 6th 5-year plan, the drainage system in the south-western parts of the Belorussian SSR, in the Poltavsk part of the Ukrainian SSR, and in other parts of the USSR, is to be greatly developed. Only 8,4 million hectares out of a total of 100 million hectares of marshes or marshy soils were being drained at the beginning of 1957. More than 4 million of these undrained hectares are used as natural meadows and pastures with low yields.

"APPROVED FOR RELEASE: 07/13/2001

CIA-RDP86-00513R001550010012-6

SHTIRK, B.

"Tobreadors of 'Stomatology', " Stomatologiya, No. 3, 1949. Docent.

APPROVED FOR RELEASE: 07/13/2001

CIA-RDP86-00513R001550010012-6"

SHTARK, M.B.

Mechanism of action of a peridural block of the spinal roots in  
ischias. Sov.med. 20 no.11:68-73 N '56. (MLRA 10:1)

1. Iz lechebno-profilakticheskogo ob'yedineniya sanitarnogo otdela  
upravleniya "Molotovstroy" (nachal'nik Ye.M.Itkin, glavnnyy vrach  
V.F.Dorogavtseva)

(BACKACHE, ther.

procaine penicillin blockade in ischias)

(PENICILLIN, rel. cpds.

same)

SHTARK, M.B.

Functional morphology of the afferent systems of the splanchnic nerves.  
Biul. eksp. biol. med. 47 no.5:110-113 My '59. (MIRA 12:7)

1. Iz kafedry normal'noy anatomii (zav. - prof. I.I. Kositsyn) Permskogo  
meditsinskogo instituta. Predstavlena deystvitel'nym chlenom AMN SSSR  
V.M. Chernigovskim.

(SYMPATHETIC NERVOUS SYSTEM, physiol.  
splanchnic nerve afferent sympathetic fibers, funct.  
morphol. (Rus))

SHTARK, V.E., Cand Med Sci — (diss) "The aff rent systems of the ~~hypothalamic~~  
~~splanchnic~~  
~~gutato~~ nerves. (Morphology, sources of formation, electrophysiolo-  
gical characteristics)." Perm', 1959. 14 pp (Perm' State Med Inst)  
(IL,40-59, 107)

72

SHTARK, M.B., kand.meditinskikh nauk

Epidemic cerebrospinal meningitis with 12 relapses. Sov. med. 24  
no.6:121-122 Je '60. (MIRA 13:9)

1. Iz nervnogo otdeleniya Gorodskoy bol'nitsy No.21 Permi (glavnyy  
vrach G.P. Dolmatov).  
(MENINGITIS, CEREBROSPINAL)

SIZOV, G.G.; SHTARK, M.B.

Therapeutic effect of hexonium in pruritic dermatoses. *Vest.derm.*  
i ven. 35 no.4:62-64 Ap '61. (MIRA 14:5)

1. Iz Permskogo gorodskoy bol'nitsy No.21 (glavnnyy vrach G.P.  
Dolmatov).  
(HEXONIUM COMPOUNDS) (PRURITUS)

MARINESCU, G. [Marinescu, G.]; TEYNDEL', K.; PREDESKU, I.; SHTARK, M.;  
KONSTANTINESCU, M.; SANDULESKU, T.

Paralysis of the facial nerve in influenza. Vop. virus 6 no.4: 509-  
510 Jl-Ag '61. (MIRA 14:11)

1. Virusologicheskiy institut Akademii Rumynskoy Narodnoy Respubliki  
i kliniki infektsionnykh bolezney "Kolentina", Bukharest.  
(PARALYSIS, FACIAL) (INFLUENZA)

SHTARK, M.B.

Electrophysiological study of hibernation. Fiziol. zhur. 47 no.8:  
942-949 Ag '61. (MIRA 14:8)

1. From the Electrophysiological Laboratory City Hospital No.21,  
Perm'. (HIBERNATION) (ELECTROPHYSIOLOGY)

MARINESCU, G. [Marinescu, G.]; SHTARK, M. [Stark, M.]; TEYNDEL, K. [Teindel, K.]; KUCHURYANU, S. [Cuciureanu, S.]; STROYESKU, K. [Stroescu, C.]; SANDULESKU, T. [Sandulescu, T.]

Case of acute myopathy in influenza; recovery. Vop.virus. 7 no.6:739 N-D '62. (MIRA 16:4)

1. Virusologicheskiy institut Akademii nauk Rumynskoy Narodnoy Respubliki i Bukharetskaya klinika infektsionnykh bolezney. (MUSCLES—DISEASES) (INFLUENZA)

SHTARK, M.B.

Biopotentials of the human spinal cord in a normal state and under pathological conditions. Fiziol. zhur. [Ukr.] 8 no.1:120-127 Ja-F '62. (MIR 15:2)

1. Laboratoriya elektrofiziologii Odesskogo nauchno-issledovatel'skogo psikhonevrologicheskogo instituta. (SPINAL CORD) (ELECTROPHYSIOLOGY)

SHTARK, M.B.

Interrelationship of the electrical and metabolic activities in  
the olfactory bulb of hibernating animals. Biul. eksp. biol. i  
med. 55 no.4:14-18 Ap '63.

(MIRA 17:10)

1. Iz laboratorii elektrofiziologii (zav. - kand. med. nauk M.B.  
Shtark, nauchnyy konsul'tant - prof. F.N. Serkov) Nauchno-issle-  
dovatel'skogo psikhonevrologicheskogo instituta (dir. A.G. Le-  
shchenko), Odessa. Predstavlena deystvitel'nym chlenom AMN SSSR  
A.V. Lebedinskym.

SHTARK, M.B.; DANILYUK, V.P.

Induced potentials in the cerebral cortex of hibernating animals.  
Dokl. AN SSSR -~~151~~ no.3:740-743 J1 '63. (MIRA 16:9)

1. Odesskiy nauchno-issledovatel'skiy psichoneurologicheskiy  
institut. Predstavлено академиком V.N.Chernigovskim.  
(Cerebral cortex) (Hibernation) (Electrophysiology)
